UNFC (2004) CLASSIFICATION OF COAL RESOURCES OF CIL BLOCKS AS ON 01.04.2013 (Excluding 119 assigned blocks)

1.0 Reference:

In line with the decision taken in the 80th Meeting of CMDs held on 11.11.2013, CMPDI undertook the work of coal resource & reserve estimation of CIL blocks as on 01.04.2013 based on UNFC 2004 system. Accordingly, this report has been prepared after collecting the block-wise information from the regional institutes of CMPDI.

2.0 Introduction

Although the systematic exploration for coal in India started about 65 years back, sometimes in the year 1945, coal did not play a leading role in the country's economy for quite some time, and no attempt was made to standardize the related terminology and resource classification till late 1950s. The erstwhile Ministry of Production, by a resolution No. 25-CI (12) / 56 dated the 28th August 1956, set up "Coal Council of India" (CCI) to supervise and guide the development of the coal resources of the country.

The Committee on Assessment of Resources (CAR) of the CCI drew up the "Indian Standard Procedure for Coal Reserve Estimation" (ISP) in 1957 defining a procedure for coal reserve estimation in existing and closed mines and in virgin leased and un-leased areas. The ISP system classified the coal resources on the basis of increasing confidence of geological studies (Inferred, Indicated, and Proved), thickness and depth ranges, and coal rank and quality considerations. The ISP also made stipulations for assessment for opencast and underground mining extractability and depletion.

No administrative and statutory structure for the implementation of the ISP was, however, identified. While the Govt. and Public Sector organizations involved in coal exploration at the time, namely, Geological Survey of India (GSI), Indian Bureau of Mines (IBM) and National Coal Development Corporation Ltd. (NCDC), adopted the ISP for classification of coal resources explored by them, there was hardly any information about the resources being exploited by the numerous private entrepreneurs of the time and no central organization was there for collating and inventorying the same. As a result, comprehensive estimation of the country's coal resources inventory could not be made by any organization.

The Planning Commission eventually set up a Task Force on Coal and Lignite in 1972 to arrive at an estimate of coal resources of the country, for the first time, on the lines of ISP.

This was the time prior to the nationalization of coal industry in India. Central Mine Planning and Design Institute Ltd. (CMPDI) was constituted under the newly formed Coal India Ltd. (CIL) for assessment and detailed exploration of the coal resources to aid the envisaged leap in coal production. Collating the data from CMPDI and Singareni Collieries Co. Ltd. (SCCL), the GSI brought out the coal resource inventory of the country in 1976, 1978, 1984, 1986 and annually from 1988 onwards.

With the experience gained from the ISP and the practical limitations noticed, the Committee on Assessment of Coal Resources (CACR), reconstituted by the Coal Controller of India, headed by representative from CMPDI from the coal industry, proposed fundamental changes to the structure of the coal resources classification system in May 1981. The basic issues discussed and incorporated were the probabilities associated with estimation of resources of different categories and the bifurcation of coal resources into economically mineable "reserves" and other "resources". Modifications were suggested on quality and thickness classes, recoverable resources were highlighted and specific densities of drilling were proposed on different bases including likely structural complexity.

Concurrently, the Committee on Standardization of Terminology and Classification of Ore and Mineral Resources (CSTCOMR) of the GSI brought out a system of coal reserve classification in June 1981 which was more or less identical with the CACR system. Neither the CACR nor the CSTCOMR systems could, however, be utilized for inventorying purpose and, therefore, remained theoretical in scope.

The Task Force on Assessment of Coal Resources constituted in 1989 by the Central Geological Programming Board (CGPB) of GSI, however, redefined the ISP criteria for indicated and inferred resources as well as the depth, thickness and quality classes. The inventory of coal resources of India as maintained by GSI, regularly from 1988 onwards, is based on this revision of the ISP (1957).

As per Indian Standard Procedure (ISP) the coal resources are classified into

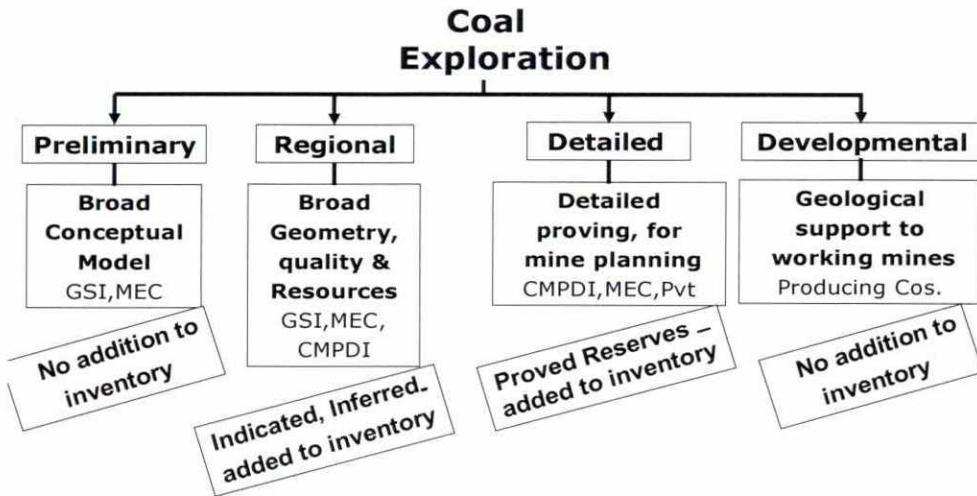

- ✓ **Proved:** The coal resources of an area falling within 200 m radius from a borehole point (or observation point).
- ✓ **Indicated:** Those resources occurring in the area falling between radii of 200m and 1km from a borehole point.
- ✓ **Inferred:** Those resources occurring in the area falling between radii of 1km and 2km from a borehole point.

The other parameters of the classification are thickness (more than 0.9m), depth (down to 1200m from surface) and quality (grade) of the coal in a seam.

Exploration Stages vis-a-vis Resource Classes

CMPDI

Different Stages of Coal Exploration

The ISP addresses only the volume and tonnage, i.e. the resource of coal but not the accuracy of structural delineation; the resource of the 'Proved' category are more or less assured to be available in the ground, but the deciphered geological structure of the proved block may not have the same level of assurance.

The ISP provides a firm framework to the study and assessment of coal resources and development of exploration practices. The different stages of coal resource assessment and exploration that eventually evolved with more-or-less well-defined functions are given below:

The Scope of Different Stages of Coal Exploration

Sr. No.	Exploration Stages	Purpose	Contribution to Coal Inventory – Categorize
1	Preliminary	Broad identification of coal occurrences	None
2	Regional	Firm identification of coal occurrences with 1-2 drill holes per sq .km	Indicated and Inferred Resource
3	Detailed	Detailed proving of deposit with more than 8-9 drill holes per sq. km	Proved Reserves
4	Developmental	Geological support to working mines	None

3.0 Need for Review of Resource Classification System:

The Indian Standard Procedure (1957) considered only the basic criterion of geological certainty for classifying coal resources with associated classes for thickness, quality and depth.

Internationally, different countries evolved and followed their own coal reserve classification systems, which were not mutually related. In the 80s and 90s, the Committee on Sustainable Energy (CSE) of the Economic Commission for Europe (ECE), under the aegis of UNESCO, developed a coal reserve classification system titled United Nations Framework Classification (UNFC) which was adopted by all the European countries.

There are two basic precepts of the UNFC for mineral reserve / resource classification as contained in its guidelines, the attempted universality of application and the activity-linked approach for resource/reserve classification. The UNFC type of classification system has the obvious advantage of providing a ready and well defined picture of coal occurrences for investments and exploitation.

In November 2000, a meeting was organized at Agra, India, by the Ministry of Mines, Govt. of India, on the subject and decision was taken to evolve UNFC-compatible reserve classification system in India.

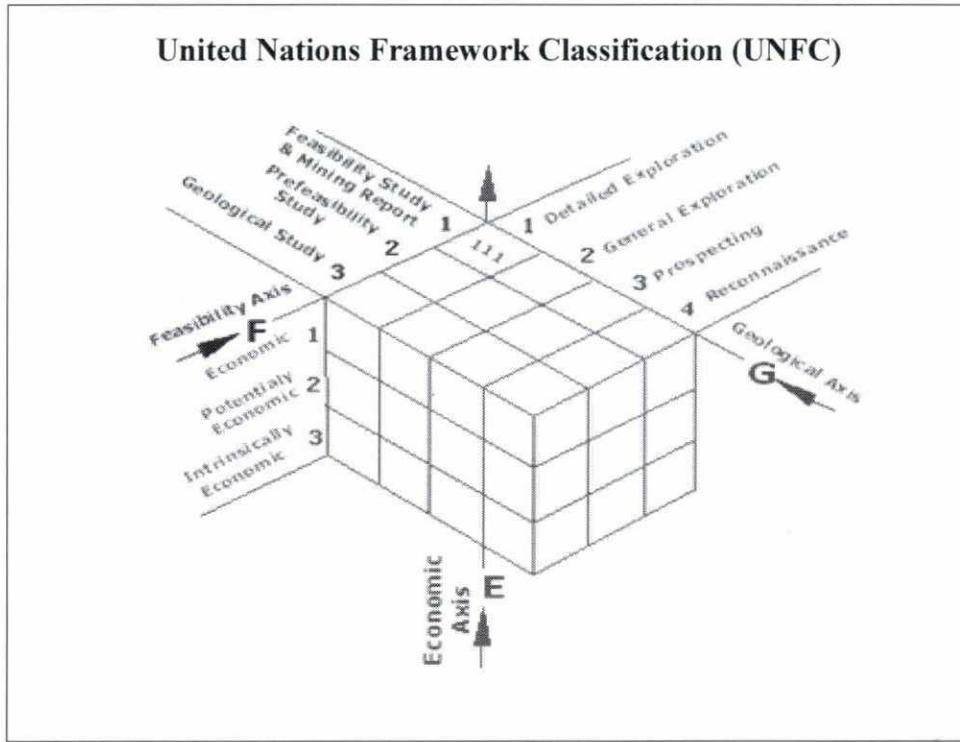

In December 2001 a conclave of serving and retired senior technical officials of the Indian coal industry was held at Delhi at the instance of the Ministry of Coal (MoC), organized by CMPDI. Amongst the issues discussed was the concern about the recoverable resources out of the relatively large coal inventory of the country and the sustainability of coal production, underlining the need for UNFC-type classification of coal resources in the country.

The Sub-Group II of the Working Group on Coal and Lignite of the MoC for the drawal of the Xth Plan (2002-03 to 2006-07) document also proposed funding for a five year project for creation of coal resource data base on the lines of UNFC under the Promotional (Regional) Exploration program of MoC which was approved in 2004.

4.0 The UNFC and the Indian Perspective

4.1 United Nations Framework Classification (UNFC): As per binary system of coal resource classification system introduced in USA in 1982 which incorporated the degree of reliability of knowledge of the deposits (viz. Proved, Indicated, etc. of the ISP) as well as the criterion of the economic mineability, only the economically mineable occurrences were termed as Reserves while the rest were considered as Resources. This has also been updated by the **United Nations Framework Classification (UNFC)** system, adopted in

India, which adds a third dimension, viz. status of the mining feasibility study of the deposits, to the classification system to provide codification as depicted below:

4.2 The UNFC consists of a three dimensional system with three axes: Geological Assessment, Feasibility Assessment and Economic Viability.

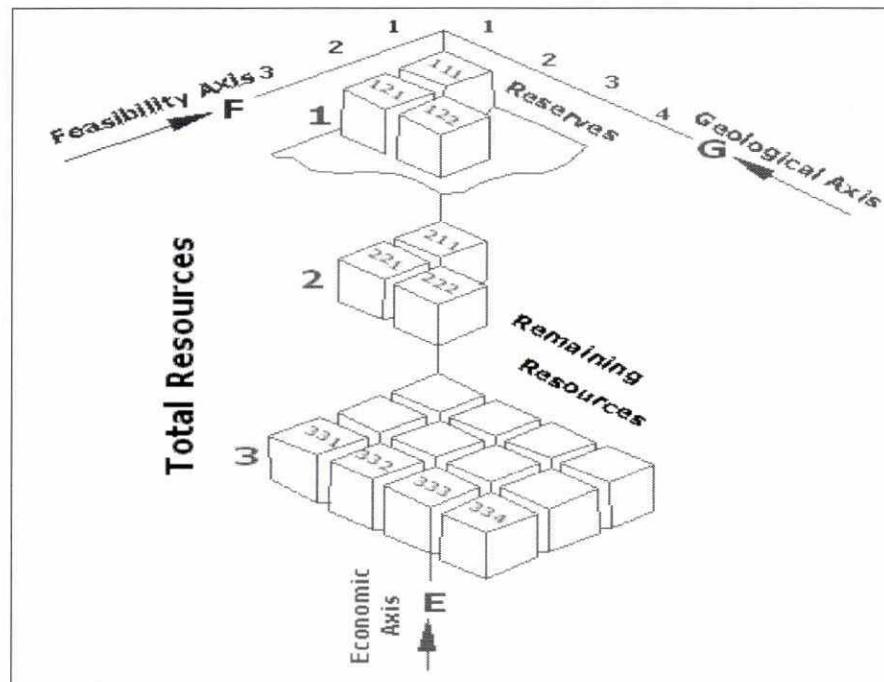

4.3 The process of geological assessment is generally conducted in stages of increasing details. The typical successive stages of geological investigation i.e. reconnaissance, prospecting, general exploration and detailed exploration, generate resource data with clearly defined degrees of geological assurance. These four stages are, therefore, used as geological assessment categories in the classification.

4.4 Feasibility assessment studies form an essential part of the process of assessing a mining project. The typical successive stages of feasibility assessment, i.e. geological study as initial stage followed by pre-feasibility study and finally the feasibility study / mining report are well defined.

4.5 The degree of economic viability (economic or sub-economic) is assessed in the course of pre-feasibility and feasibility studies. A pre-feasibility study provides a preliminary assessment with a lower level of accuracy than that of the feasibility study in which economic viability is assessed in detail.

4.6 The three categories of economic viability have codes 1,2 and 3 in decreasing order, similarly the three categories of feasibility study have also codes 1,2 and 3 while the four stages of geological assessment are represented by 4 codes i.e. 1 (detailed exploration), 2 (general exploration), 3 (prospecting) and 4 (reconnaissance).

4.7 The UNFC is, therefore, a three digit code based on system wherein the first digit represent economic viability axis, second digit represent feasibility axis & third digit represent geologic axis. Each of these axes has further codes in decreasing order. The Economic viability has codes 1, 2 and 3 in decreasing order. Similarly the feasibility assessment has codes 1, 2 and 3. The geological assessment has 4 codes i.e. 1- Detailed Exploration 2- Regional Exploration 3- Prospecting & 4- Reconnaissance. Thus the highest category of resources under UNFC system will have the code (111) and the lowest category will have the code (334).

**Codification of Resources as per United Nations
Framework Classification (UNFC)**

ECONOMIC AXIS (E)	FEASIBILITY AXIS (F)	GEOLOGICAL AXIS (G)		
		Proved(1)	Indicated(2)	Inferred(3)
Economical (1)	PR Available (1)	111	112	113
	Pre-feasibility study (2)	121	122	123
	PR not available (3)	131	132	133
Marginally Economical (2)	PR Available (1)	211	212	213
	Pre-feasibility study (2)	221	222	223
	PR not available (3)	231	232	233
Sub- Economical (3)	PR Available (1)	311	312	313
	Pre-feasibility study (2)	321	322	323
	PR not available (3)	331	332	333

4.8 Therefore, the code 111 is used for a deposit with Proved reserves economically mineable presently as established by a detailed mine feasibility study.

5.0 Codes of Different Categories:

5.1 Codes of Economic (E) Category:

5.1.1 Economic (E1): Feasibility or pre-feasibility study shows that the deposit which can be profitably mined or extracted under the present economic, technological and political conditions are termed as economic deposit.

The term economic comprises both normal economic and exceptional economic as defined below.

- **Normal Economic Reserves:** Normal economic reserves are reserves that justify economic extraction under normal market conditions. Thus, the average value of the commodity mined per year must be such as to satisfy the required return on investment.
- **Exceptional (conditional) Economic Reserves:** Exceptional (conditional) economic reserves are reserves which are not economic at present under normal market conditions but can be made economic by other means like increasing the sale value, government subsidies and/or other supportive measures etc.

5.1.2 Potentially Economic (E2): Feasibility or pre-feasibility study indicates that the deposits which can not be mined or extracted economically at present are termed as potentially economic.

The term potentially economic comprises both marginal and sub-marginal as defined below.

- **Marginally Economic:** Marginal economic resources are resources which at the time of determination are not economic, but border on being so. They may become economic in the near future as a result of changes in technological, economic, environmental and/or other relevant conditions.
- **Sub-marginal Economic:** Sub-marginal economic resources are resources that would require a substantially higher commodity price or a major cost-reducing advance in technology to render them economic.

5.1.3 Intrinsically economic (E3): The deposits for which, neither a feasibility study nor a pre-feasibility study have been conducted and only the results of geological study are available, are termed as intrinsically economic.

5.2 Codes of Feasibility Study (F) Category:

5.2.1 Feasibility Study (F1): A Feasibility Study assesses in detail the technical soundness and economic viability of a mining project, and serves as the basis for the investment decision and as a bankable document for project financing. The study constitutes an audit of all geological, engineering, environmental, legal and economic information accumulated on the project. Generally, a separate environmental impact study is required.

5.2.2 Pre-feasibility Study (F1): Pre-feasibility Study provides a preliminary assessment of the Economic Viability of a deposit and forms the basis for justifying further investigations (detailed exploration and feasibility study). The Pre-feasibility Study addresses the items listed under the feasibility study, although not in as much details.

5.2.3 Geological Report (F3): The deposits for which neither feasibility study nor pre-feasibility has been conducted only geological reports are available.

5.3 Codes of Geological (G) Category:

5.3.1 G1 Category: Quantity of known mineral deposits which has been estimated with high level of confidence. The proved reserve in ISP classification may be categorized in this group.

5.3.2 G2 Category: Quantity of known mineral deposits which has been estimated with moderate level of confidence. The indicated reserve in ISP classification may be categorized in this group.

5.3.3 G3 Category: Quantity of known mineral deposits which has been estimated with low level of confidence. The inferred reserve in ISP classification may be categorized in this group.

5.3.4 G4 Category: Quantity of potential mineral deposits based primarily on indirect evidence (Reconnaissance).

6.0 Classification of Coal Resources under CIL as per UNFC

The Controller General of Indian Bureau of Mines has issued comprehensive Guidelines under MCDR for United Nations Framework Classification of Mineral Reserves/Resources (Annexure I). These guidelines, apart from the definition of terms and codes on reserves and resources under United Nations Framework Classification (UNFC) also provide the field guidelines for adoption of UNFC and accordingly Indian coal resource/reserve has been codified as given in the table below:

Code	Code Description
A. Coal Reserve	
1,1,1	The resource is of G1 category, feasibility study (F1) has been made and economically viable (E1). The balance Mineable Reserve (excluding that of losing mines) as on date will be in this category
1,2,1	The resource is of G1 category and pre-feasibility study has been made only. But, it indicates that the exploitation will be economic
1,2,2	The resource is of indicated (G2) category and pre-feasibility study (F2) has been made only & indicates that the exploitation will be economic (E1)
B. Remaining Resource	
2,1,1	The resource is of G1 category, feasibility study (F1) has been made and found potentially economic (E2).
2,2,1	The resource is of G1 category, pre-feasibility study has been made and found potentially economic. In our case the losses during mining operation has been included in this category & can be computed by deducting the estimated mineable reserve from the geological reserve considered in PR.
2,2,2	The resource is G2 category, pre-feasibility study (F2) has been made and found potentially economic (E2).
3,3,1	The resource is of G1 category, no study has been made but GR is available & hence economic criteria not determined (E3).
3,3,2	The resource is of G2 category, no study has been made & hence economic criteria not determined.
3,3,3	The resource is of G3 category , no study has been made & hence economic criteria not determined

Summary of UNFC Classification of CIL Blocks as on 01.04.2013, excluding 119 assigned blocks, is given below and the subsidiary-wise block-wise details are enclosed:

7.0 Limitations:

- As per the UNFC classification, coal which cannot be mined economically as per present study, will be termed as 'Coal Resource' and will not be included in 'Coal Reserve'. Accordingly, balance mineable coal of running mines which are at present incurring losses have been included in the category of 'Coal Resource' although we are still winning it.
- Coal lost during mining (both under ground and open cast) and left in-situ has been included as a part of 'Coal Resource' (categorized as UNFC Code 2,2,1) although majority of it may not be mineable / extractable in future.
- Geological Reports are not available for some old mines which were taken over from private owners during nationalization. Project Reports were also not prepared for these mines. Balance mineable reserve have been estimated by Regional Institutes of CMPDI and included in the report.
